

Art Direction: Avoiding Upscaling Entirely

Using the HTML5 <picture> element for resolution switching

The Problem: width: 100% Upscaling

$$\text{Scale Factor} = \frac{\text{Container (1200px)}}{\text{Native (400px)}} = 3.0x$$

At 3.0x scale, the browser mathematically forces 1 real pixel to stretch across 9 pixels (3 × 3), causing severe interpolation blur.

```
index.html

<picture>
  <source media="(min-width: 1024px)"
    srcset="hero-desktop.jpg">
  <source media="(min-width: 768px)"
    srcset="hero-tablet.jpg">
  
</picture>
```

💡 **How Art Direction solves math problems:**

Instead of forcing a single low-res image to stretch (multiplying fake pixels) or a high-res image to shrink (wasting bandwidth), the browser intelligently evaluates the container's physical size and downloads a **mathematically appropriate** native file. Combined with max-width: 100% on the inner , the image remains perfectly crisp with zero interpolation overhead.
