How object-fit and object-position handle fluid responsive layouts

🖥️ Desktop Viewport (16:9 Container)

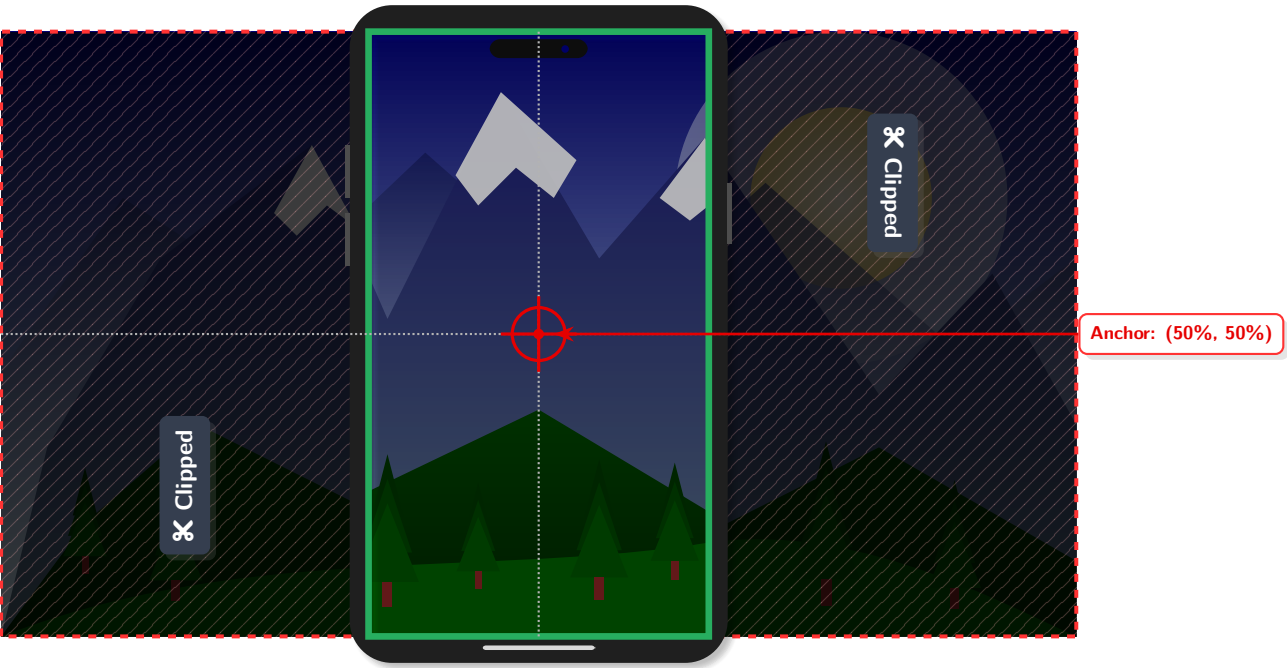

Default: object-position: 50% 50%
The browser automatically centers the image. However, the critical focal point (the subject's face) is dangerously close to being cropped off on ultra-wide screens.

Art Direction: object-position: 50% 20%
By shifting the coordinate matrix relative to the container, we explicitly anchor the image to the subject's face, ensuring it survives the aggressive 16:9 vertical crop.

📱 Mobile Viewport (9:16 Container)

Default Center Crop
The container shrinks horizontally. The rendering engine maintains scale based on the container's height, mercilessly cropping the left and right peripheral data.

Contextual Focus: object-position: 100% 50%
By anchoring the coordinate system to the right edge (100% X), we override the default center-cut, directing the composition to focus on the sun rather than the mountain.
