

Hardware Density Grid Metrics & **srcset**

How 1x, 2x descriptors command the engine to map logical pixels to physical device grids.

1. The Pixel Grid Mapping (Logical vs. Physical)

2. The OS Query & Layout Disconnect

Strict Hardware Command (The Absolute Rule)

When 1x, 2x modifiers are used, the browser makes the download decision based solely on the OS hardware metrics. The fluid CSS layout (e.g., `width: 100%` or `50vw`) is evaluated after the image source is selected, meaning responsive fluid widths cannot influence density descriptor logic.
