

 srcset (Advisory) vs. <picture> (Directive)

Resolution Switching vs. Art Direction: Browser Autonomy vs. Deterministic Control

i The Advisory Principle (Resolution Switching): The `srcset` and `sizes` attributes do **not** force the browser to download a specific image. They merely provide a menu of available resources and geometric hints. The browser is explicitly designed to retain absolute autonomy. It evaluates its current environment (network speed, battery level, cache, pixel density) and autonomously selects the most optimal image to download. *Developers suggest; the browser decides.*

⚠ The Directive Principle (<picture> Art Direction): Unlike `srcset`, the `<picture>` wrapper bypasses heuristic evaluation entirely. It provides strict, hardcoded execution parameters where media query conditions dictate the exact asset to load. The browser must match rules in top-down sequential order and cannot override decisions based on network speed, battery state, or data saver settings. *Developers dictate; the browser obeys.*
